

Dynatrace Configuration Workshop

40-Minute Interactive Session (No Lab Environment Required)

Workshop Overview

Participants will work through real-world scenarios and provide configuration inputs for Dynatrace monitoring solutions. This hands-on planning exercise prepares teams to implement Dynatrace effectively.

Session Structure

Introduction (5 minutes)

- Workshop objectives
 - Quick Dynatrace capabilities overview
 - Scenario-based approach explanation
-

Use Case 1: E-Commerce Application Performance Issues (10 minutes)

Scenario Background

Your e-commerce application is experiencing:

- Slow checkout page load times (8-12 seconds)
- Customer complaints about cart abandonment
- Intermittent payment gateway timeouts
- Database performance degradation during peak hours

Interactive Activity: Configuration Planning

Facilitate participant discussion and capture inputs:

1. What metrics would you monitor?

Capture participant responses:

- Response time metrics
- User session data
- Transaction flow timing
- Database query performance
- Third-party API calls (payment gateway)
- Infrastructure metrics (CPU, memory, disk I/O)

2. What alerts would you configure?

Capture threshold values:

- Alert 1: _____
 - Threshold: _____
 - Notification channel: _____

3. Which dashboards would be most valuable?

Participant priorities:

- Dashboard 1: _____
 - Dashboard 2: _____
 - Key stakeholders: _____
-

Use Case 2: Microservices Architecture Monitoring (10 minutes)

Scenario Background

Your organization has:

- 25+ microservices across Kubernetes clusters
- Services communicating via REST APIs and message queues
- Recent deployment failures causing cascading issues
- Need for better service dependency visibility

Interactive Activity: Monitoring Strategy

Capture participant inputs:

1. Service Monitoring Approach

Which services need priority monitoring?

- Critical service 1: _____
- Critical service 2: _____
- Critical service 3: _____

Rationale: _____

2. Distributed Tracing Configuration

What transaction flows to trace?

- End-to-end flow 1: _____
- End-to-end flow 2: _____

Sampling strategy: _____

3. Service-Level Objectives (SLOs)

Define SLOs for key services:

Service: _____

- Availability target: _____
- Latency target (p95): _____
- Error rate threshold: _____

4. Anomaly Detection Rules

What behaviors should trigger investigation?

- Anomaly 1: _____
 - Anomaly 2: _____
 - Anomaly 3: _____
-

Use Case 3: Cloud Migration Monitoring (5 minutes)

Scenario Background

Your team is migrating from on-premises to AWS:

- 50 applications over 6 months
- Need to compare before/after performance
- Executive reporting requirements
- Hybrid environment during migration

Rapid-Fire Planning

Capture quick participant inputs:

1. Baseline Metrics to Capture

Pre-migration: _____ Post-migration: _____

2. Success Criteria

Metric 1: _____ Metric 2: _____

Metric 3: _____

3. Reporting Needs

Weekly report must include: _____ Executive dashboard shows: _____

4. Risk Mitigation

Monitoring safeguard 1: _____ *Monitoring safeguard 2:*
